and principles of ethics, the text encourages students to apply ethics to such areas change, regulation, technology and fiscal responsibility. This book discusses the philosophical foundations of bioethics, with a particular focus on the tensions and potential dilemmas generated by the intuitionist meta-ethical commitments of the predominant normative theory, namely "the four principles approach." This view is based on the prima facie norms of respect for autonomy (one ought to respect the autonomous choices of subjects of scientific research/patients), non-maleficence (one ought to refrain from inflicting harm), beneficence (one ought to do good and prevent, or remove, harm) and justice (one ought to treat people fairly). The tensions in applying these basic principles may lead to inaction in scientific experiments involving human subjects or to arbitrary applications of the norms in the art of caring. The problem can be made explicit in these terms: on the one hand, caring without respecting seems blind,

degenerating into forms of paternalism when, for instance, the carer imposes her conception of the good life or a particular procedure on the cared-for; on the other hand, respecting without caring amounts to indifference or individualism when, for example, a person does not look after a vulnerable being properly. The initial hypothesis of this book, then, is that the concept of respectful care can be built up, working from an ethico-philosophical perspective, to be a leading notion capable of guiding our daily actions and bioethical practices.

This book discusses the common principles of morality and ethics derived from divinely endowed intuitive reason through the creation of al-fitr' a (nature) and human intellect (al-'aql). Biomedical topics are presented and ethical issues related to topics such as genetic testing, assisted reproduction and organ transplantation are discussed. Whereas these natural sources are God's special gifts to human beings, God's revelation as given to the prophets is the supernatural source of divine guidance through which human communities have been guided at all times through history. The second part of the book concentrates on the objectives of Islamic religious practice - the maqa' sid - which include: Preservation of Faith, Preservation of Life, Preservation of Mind (intellect and reason), Preservation of Progeny (al-nasl)

and Preservation of Property. Lastly, the third part of the book discusses selected topical issues, including abortion, assisted reproduction devices, genetics, organ transplantation, brain death and end-of-life aspects. For each topic, the current medical evidence is followed by a detailed discussion of the ethical issues involved.

Law and Ethics in Children's Nursing is an important and practical guide on the legal and ethical aspects of child healthcare that enables nurses to understand the legal and ethical principles that underpin everyday nursing practice. It explores the concept of childhood and children's rights, the extent to which their rights are upheld in a variety of settings, and the relationship between law and ethics and how they interact in resolving problems and dilemmas that commonly arise in practice. With case studies, learning outcomes and scenarios throughout, Law and Ethics in Children's Nursing places the care and treatment of children in a legal and ethical framework, and explores the way in which legal and ethical aspects of children's nursing differ from those of adults. It explores general principles such as autonomy and consent, confidentiality, accountability and negligence. It then goes on to look at specialist areas such as abortion, sterilisation, research, mental health, organ donation, child protection and death.
