These reports summarize the current state of what is known about various health and healthcare issues that affect the United States. An introductory chapter gives an overview of the report as a whole, along with a look at the science and preparation of the report. Along with the findings, reports may present directories of related resources.

This first-ever Surgeon General's Report on bone health and osteoporosis illustrates the large burden that bone disease places on our Nation and its citizens. Like other chronic diseases that disproportionately affect the elderly, the prevalence of bone disease and fractures is projected to increase markedly as the population ages. If these predictions come true, bone disease and fractures will have a tremendous negative impact on the future well-being of Americans. But as this report makes clear, they need not come true by working together we can change the picture of aging in America. Osteoporosis, fractures, and other chronic diseases no longer should be thought of as an inevitable part of growing old. By focusing on prevention and lifestyle changes, including physical activity and nutrition, as well as early diagnosis and appropriate treatment, Americans can avoid much of the damaging impact of bone disease and other chronic diseases. This Surgeon General's Report brings together for the first time the scientific evidence related to the prevention, assessment, diagnosis, and treatment of bone disease. More importantly, it provides a framework for moving forward. The report will be another effective tool in educating Americans about how they can promote bone health throughout their lives. This first-ever Surgeon General's Report on bone health and osteoporosis provides much needed information on bone health, an often overlooked aspect of physical health. This report follows in the tradition of previous Surgeon Generals' reports by identifying the relevant scientific data, rigorously evaluating and summarizing the evidence, and determining conclusions.

Our nation stands at a crossroads. Today's epidemic of overweight and obesity threatens the historic progress we have made in increasing American's quality and years of healthy life. Two-third of adults and nearly one in three children are overweight or obese. In addition, many racial and ethnic groups and geographic regions of the United States are disproportionately affected. The sobering impact of these numbers is reflected in the nation's concurrent epidemics of diabetes, heart disease, and other chronic diseases. If we do not reverse these trends, researchers warn that many of our children—our most precious resource—will be seriously afflicted in early adulthood with medical conditions such as diabetes and heart disease. This future is unacceptable. The Surgeon General asks you to join me in combating this crisis. Every one of us has an important role to play in the prevention and control of obesity. Mothers, fathers, teachers, business executives, child care professionals, clinicians, politicians, and government and community leaders—we must all commit to changes that promote the health and wellness of our families and communities. As a nation, we must create neighborhood communities that are focused on healthy nutrition and regular physical activity, where the healthiest choices are accessible for all citizens. Children should be having fun and playing in environments that provide parks, recreational facilities, community centers, and walking and bike paths. Healthy foods should be affordable and accessible. Increased consumer knowledge and awareness about healthy nutrition and physical activity will foster a growing demand for healthy food products and exercise options, dramatically influencing marketing trends. Hospitals, work sites, and communities should make it easy for mothers to initiate and sustain breastfeeding as this practice has been shown to prevent childhood obesity. Working together, we will create an environment that promotes and facilitates healthy choices for all Americans. And we will live longer and healthier lives. In the 2001 Surgeon General's Call to Action to Prevent and Decrease Overweight and Obesity, former Surgeon General David Satcher, MD, PhD, warned us of the negative effects of the increasing weight of our citizens and outlined a public health response to reverse the trend. Although we have made some strides since 2001, the prevalence of obesity, obesity-related diseases, and premature death remains too high. The Surgeon General is calling on all Americans to join in a national grassroots effort to reverse this trend. Plans include showing people how to choose nutritious food, add more physical activity to their daily lives, and manage the stress that so often derails their best efforts at developing healthy habits. The real goal is not just a number on a scale, but optimal health for all Americans at every stage of life. To achieve this goal, we must all work together to share resources, educate our citizens, and partner with business and government leaders to find creative solutions in our neighborhoods, towns, and cities from coast to coast. Together, we can become a nation committed to become healthy and fit.

The 2015-2020 Dietary Guidelines is designed to help Americans eat a healthier diet. Intended for policymakers and health professionals, this edition of the Dietary Guidelines outlines how people can improve their overall eating patterns - the complete combination of foods and drinks in their diet. This edition offers 5 overarching Guidelines and a number of Key Recommendations with specific nutritional targets and dietary limits.

Though it is highly preventable, tooth decay is a common chronic disease both in the United States and worldwide. Evidence shows that decay and other oral diseases may be associated with adverse pregnancy outcomes, respiratory disease, cardiovascular disease, and diabetes. However, individuals and many health care professionals remain unaware of the risk factors and preventive approaches for many oral diseases. They do not fully appreciate how oral health affects overall health and well-being. In Advancing Oral Health in America, the Institute of Medicine (IOM) highlights the vital role that the Department of Health and Human Services (HHS) can play in improving oral health and oral health care in the United States. The IOM recommends that HHS design an oral health initiative which has clearly articulated goals, is coordinated effectively, adequately funded and has high-level accountability. In addition, the IOM stresses three key areas needed for successfully maintaining oral health as a priority issue: strong leadership, sustained interest, and the involvement of multiple stakeholders from both the public and private sectors. Advancing Oral Health in America provides practical recommendations that the Department of Health and Human Services can use to improve oral health care in America. The report will serve as a vital resource for federal health agencies, health care professionals, policy makers, researchers, and public and private health organizations.

This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.

This Surgeon General's report details the causes and the consequences of tobacco use among youth and young adults by focusing on the social, environmental, advertising, and marketing influences that encourage youth and young adults to initiate and sustain tobacco use. This is the first time tobacco data on young adults as a discrete population have been explored in detail. The report also highlights successful strategies to prevent young people from using tobacco.
